EPIDEMIOLOGICAL ESTIMATES

| | Estimate | Notes / Interpretation |
|--|-----------------------------------|---|
| Cases | | |
| Cumulative incidence* | 11,104.3 (per 100,000 persons) | From March 7, 2020 to March 27, 2021 there were about 11,104 (per 100,000) new cases of COVID-19 in Oklahoma. |
| Absolute change in cumulative incidence from previous week | -6.4 (per 100,000 persons) | Compared to March 14 – March 20 there were 6.4 (per 100,000) less cases of COVID-19 reported in Oklahoma during the past week (Mar 21– Mar 27). |
| Disease Severity | | |
| Case-fatality risk (crude) | 1.1% | The estimate is not adjusted for the lag time from reporting to death (i.e., delay between the time someone dies and the time their death is reported). The fatality estimate could be lower due to cases that were undiagnosed or had milder symptoms. |
| Cumulative Hospitalization rate (overall) | 637.6 (per 100,000 persons) | About 637 people per 100,000 have ever been hospitalized for COVID-19 during this outbreak. |

CASES AND DEATHS

New cases (by date of onset) and new deaths (by date of death) of COVID-19 in Oklahoma, February 2020–March 2021

Please note the different axes for new cases (top—from 0 to 7,000 for new cases) and new deaths (bottom—from 0 to 60 for new deaths). Additionally, a 7-day lag has been applied to the trend line based on information-collected to-date for 7/19 and 7/25 where within 7 days of onset date approximately 80% of the cases had been reported.

RECOVERED CASES

IMPACT OF MASK MANDATE

Rates of COVID-19 were examined from **March 17, 2020 - March 1, 2021.**

All communities that implemented mask mandates at any point in that interval were identified, with a date of implementation and expiration. Rate of new cases were calculated for each day for each community with a mask mandate (determined as number of new cases divided by the estimated 2019 population). Daily rates were also calculated for all communities without mandates. The difference between these two rates were then calculated for each community for each day. Because mandates were implemented at different times, the case rate differences were then set to a Day 0 basis (i.e., day 0 equals the day the mandate went into effect). The mean (average) of the difference was then determined for each day from day -45 (45 days prior to mandate implementation) to day 90 (90 days after implementation). A difference of zero would be interpreted as the rate of new cases was equal between communities with a mask mandate and the rest of the state without mask mandates. We then examined for the trend of differences in case rates for two time periods: from D-45 to D0, and from D14 to D90. We chose D14 because of the fact that case rates cannot be expected to immediately decline, regardless of mitigation efforts.

The graph shows that from day -45 to day 0 rates were notably higher, and increasing, in those communities that would implement mandates. This indicates that leaders were responding to local events, where their case rates were outpacing the remainder of the state.

IMPACT OF MASK MANDATES (continued)

The increase in difference was approximately 0.28 additional cases per 100,000 per day. Once mask mandates were in effect, the difference between mandated communities and non-mandated communities began to shrink, converging by approximately 0.2 cases per 100,000 per day. This reversal in slope (-0.48) is highly statistically significant ($p < 0.0001$).

This analysis included mask mandates that took effect in the summer of 2020, as well as those implemented in late fall/early winter. A similar analysis was done in January only examining those communities that had implemented mandates earlier, and very similar results were seen.

It is important to note that this is an observational study, done at an ecological level. That means that we looked at data at a community level, not for specific individuals. We cannot confirm that individuals in the mandated communities were wearing masks more frequently than individuals in communities without mandates. Nor can we confirm whether individuals who became cases did or did not wear masks regularly. As such, it is impossible to assert causation. However, the methods are scientifically rigorous, and the data are consistent and notable. The differences are not only statistically significant but also clinically meaningful. We believe that this information should be considered useful for policy makers in considering whether to adopt mandates related to masking or other mitigation efforts.

SYMPTOMS CRITERIA
