PUBLIC HEALTH STATISTICS OF OKLAHOMA

BIRTHS AND DEATHS

1951

This bulletin, Public Health Statistics, Part II, is the tenth such bulletin published annually by the Oklahoma State Department of Health and contains information relating to births, stillbirths, and deaths occurring during the year 1951. Source records for the data it contains were primarily standard certificates of birth, stillbirth, and death filed for these events which occurred within the State. The more important aspects of Oklahoma's mortality and natality experience during 1951 are discussed on the pages immediately following and are illustrated with tables and charts to aid the reader in the interpretation of the statistical data.

The discussion is followed by detailed tables giving vital statistics data for each county and for each city having a population of 2,500 or more in the 1950 Census. Other tables for the State show deaths from selected causes by age at death, sex, and race; principal causes of death for each age group and race; live births and stillbirths by attendant and place of delivery; and a historical summary covering twenty-two years. Tabulations in greater detail are on file in manuscript form at the State Department of Health, and data beyond those given in this bulletin are furnished upon request whenever possible.

POPULATION

For computing rates appearing in this publication an estimated population of 2,234,730 for the State as of July 1, 1951, was used. County and city population estimates made by the Division of Statistics of the State Department of Health also were used in computing rates for counties and cities.

RESIDENCE ALLOCATION

Mortality and natality rates based on numbers of deaths and births occurring among the resident population of an area are of greater value and meaning than rates based on numbers of deaths and births by place of occurrence. A voluntary interchange among the states, Alaska, Hawaii, and Canada of transcripts of deaths and births occurring to non-residents of the area makes it possible to count births and deaths occurring to residents of Oklahoma even though the event may have occurred outside the State. Allocation for residence within the State is made on a county and city basis.

With one exception, the tables appearing in this bulletin are based on data by place of residence. Since data by place of occurrence are sometimes needed, Table C has been included which shows the number of births, stillbirths, deaths, infant and neonatal deaths by county of occurrence.

In 1951, as in previous years, the numbers of resident births and deaths occurring outside Oklahoma exceeded the numbers of non-resident births and deaths occurring within the State. These numbers are shown in Table 1.

CAUSE OF DEATH CLASSIFICATION

Table 1
Residence Allocation, Oklahoma, 1951

	Non-Resident Certificates Excluded	Resident Transcripts Included
Births	1,427	1,716
Deaths	505	979

The result of the residence allocation procedure, therefore, for Oklahoma is a net gain in both births and deaths. Since residents of the State living in counties bordering other states are attracted to hospital facilities in these states, the largest numbers of resident births and deaths occurring outside the State occur in neighboring states, with Texas leading the list. The states which reallocated the largest numbers of transcripts to Oklahoma are shown in Table 2.

Table 2
Births and Deaths of Oklahoma Residents Occurring Outside Oklahoma, by State in which the Events Occurred
1951

State	Number	
	Births	Deaths
Total	1,716	979
Alabama	12	2
Arizona	9	31
Arkansas	435	133
California	5	41
Colorado	27	19
Florida	9	4
Illinois	8	18
Kansas	333	206
Kentucky	9	7

Mississippi	24	2
Missouri	79	65
New Mexico	43	39
Tennessee	8	13
Texas	601	283
Washington	24	6
All Others	87	94

The cause of death selected for statistical purposes from multiple causes reported on a death certificate is selected according to the procedure established in connection with the sixth revision of the International List of causes of death now called the International Statistical Classification of Diseases, Injuries, and Causes of Death. Because the sixth revision and its classification rules represented a radical departure from previous classification methods it has been necessary to publish special aids to interpreting mortality statistics when comparisons are to be made which bridge the year the sixth revision went into effect, 1949. Consequently, for the year 1949, deaths were classified both by the fifth revision rules and by the sixth revision rules and comparability ratios were established for main categories in causes of death. Such ratios provided a means for estimating how much of an increase or decrease in number of deaths for a specific cause was due to the difference in classification procedure alone.

In Table B in the Appendix numbers and rates for certain diseases for the years 1940 through 1949 have been adjusted according to comparability ratios established in 1949. Numbers and rates appearing in Table B should be used whenever it is desired to compare mortality data for 1940 - 1949 with any year subsequent to 1949.

LIVE BIRTHS

In 1951, 50,597 live infants were born to Oklahoma residents, 1,716 of whom were born outside the State. This is a number greater than that for any other year except 1947 when 52,691 were born. The birth rate for 1951, however, was 22.6 per 1,000 population, the same as that for the previous year. Of these births, 44,871 were white, 3,799 were Negro, and 1,927 were Indian, giving rates of 22.0, 26.1, and 35.8, respectively, for these population groups.

Table 3

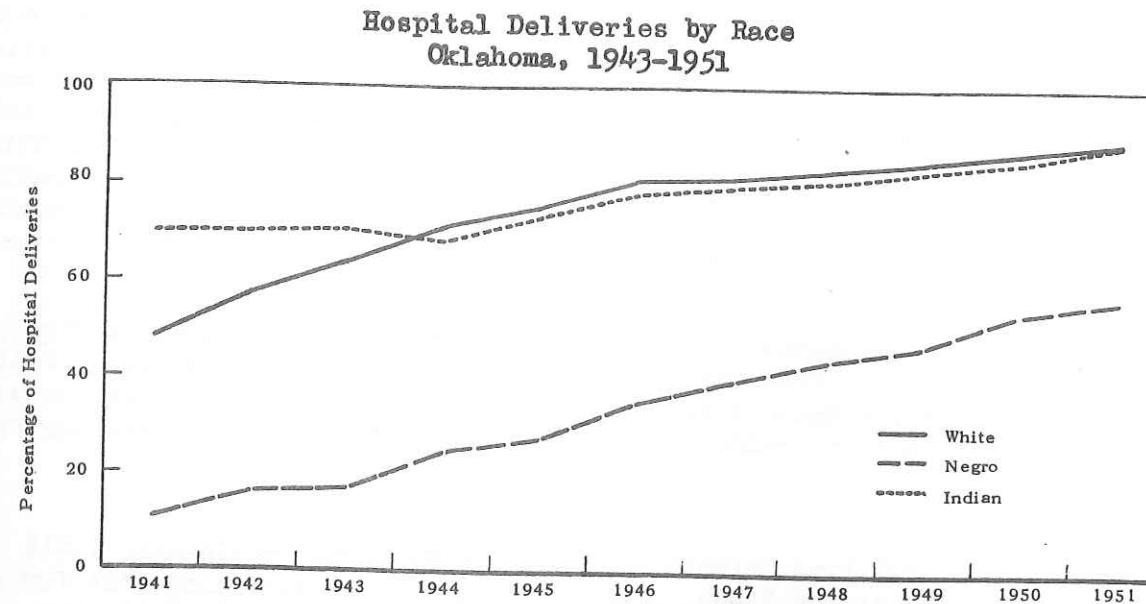

Live Birth Attendance by Race
Oklahoma, 1951

Attendance	Total		White		Negro		Indian	
	Number	Per Cent						
Total live births	50,597	100.0	44,871	100.0	3,799	100.0	1,927	100.0
Physician in hospital	43,971	86.9	40,106	89.4	2,154	56.7	1,711	88.8
Physician in mat. home	351	0.7	341	0.8	4	0.1	6	0.3
Physician in home	5,115	10.1	4,184	9.3	786	20.7	145	7.5
Midwife and other	1,160	2.3	240	0.5	855	22.5	65	3.4

The number of infants born in hospitals continues to increase each year. Almost 87 per cent of the total live births occurred in hospitals during 1951 compared with only 40 per cent in 1940. The proportions of white and Indian live births occurring in hospitals, 89.4 and 88.8 per cent respectively, were very nearly the same while that for Negro live births was lower, 56.7 per cent,

as may be seen in Table 3. In spite of this difference, however, the numbers of Negro births occurring in hospitals also is increasing each year. The increasing numbers over a period of several years may be seen in Chart 1.

Chart 1

A greater proportion of babies of mothers resident of urban areas, 93.8 per cent, were delivered in hospitals than mothers resident of rural areas, 77.5 per cent. On the other hand, 4.1 per cent of the urban live births were attended by physicians in the home compared with 18.2 per cent of the rural live births. The total proportions attended by physicians were 98.4 per cent for urban births and 96.8 per cent for rural births, as may be seen in Table 4.

Table 4

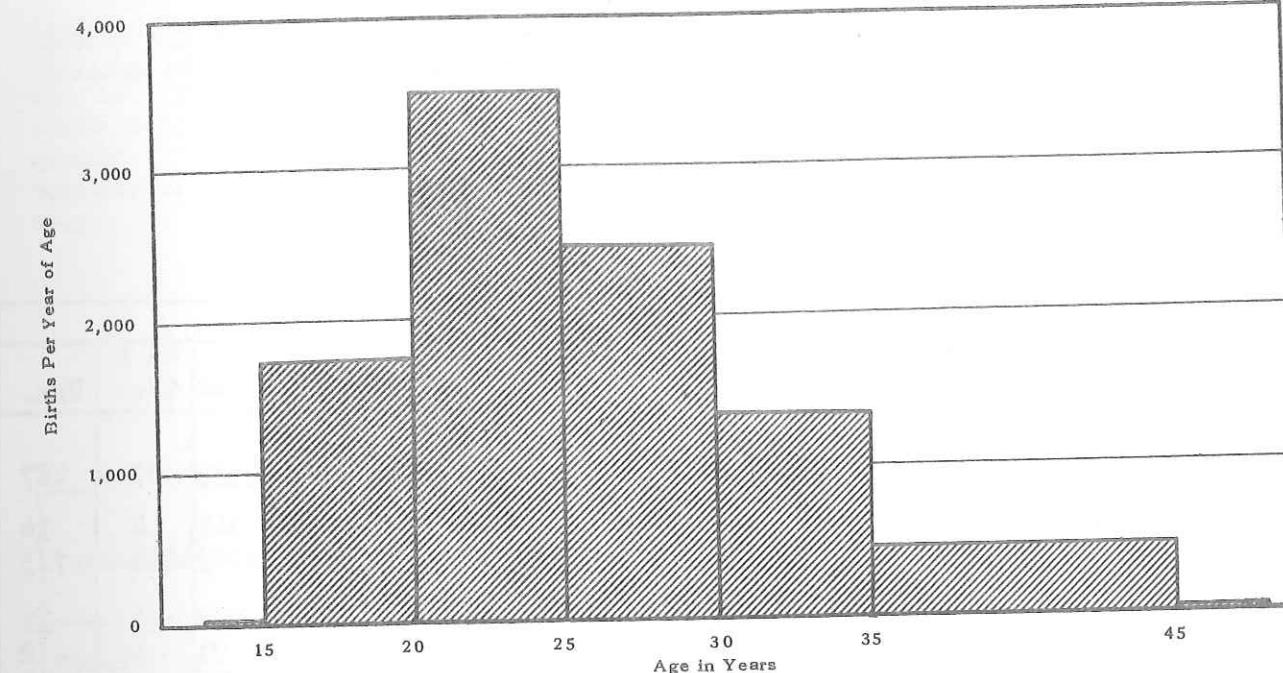

Live Birth Attendance, Urban and Rural
Oklahoma, 1951

Attendance	Total		Urban		Rural	
	Number	Per Cent	Number	Per Cent	Number	Per Cent
Total	50,597	100.0	29,134	100.0	21,463	100.0
Physician in hospital	43,971	86.9	27,341	93.8	16,630	77.5
Physician in mat. home	351	0.7	113	0.4	238	1.1
Physician in home	5,115	10.1	1,205	4.1	3,910	18.2
Midwife, other, unknown	1,160	2.3	475	1.6	685	3.2

Chart 2 shows numbers of births by age of the mother. Approximately 77 per cent of all births occurred to mothers 15-29 years of age. From the chart it may be seen that the greatest number occurred to mothers 20-24 years of age.

Chart 2

Live Births by Age of Mother
Oklahoma, 1951

Immature Births

The year 1951 makes the fourth year for which birth weight information has been available since the 1948 revision of the standard birth certificate included this item. As was found in 1950, 98 per cent of certificates filed reported birth weight information. Infants having a birth weight of five and one-half pounds or less were classified as immature. Of the number with birth weight specified, 3,370 births or 6.8 per cent were immature.

Table 5

Percentage of Immature* Live Births, by Race
Oklahoma, 1951

	Total	White	Negro	Indian
Live births with birth weight specified	49,568	44,070	3,634	1,864
Birth weight 5½ pounds or less	3,370	2,885	392	93
Per cent	6.8	6.5	10.8	5.0

* Based on birth weight alone.

There was a difference among population groups in the proportions of immature births. The highest percentage, 10.8, was observed among Negro births and the lowest, 5.0, among Indian births, while that among white births was 6.5 per cent. This comparison may be seen in Table 5.

The numbers of immature infants by birth weight and by age of the mother are shown in Table 6. The highest proportion of immature births was to mothers under fifteen years of age.

Table 6

Immature Births by Weight, and Age of Mother
Oklahoma, 1951

Birth Weight	Total	Age of Mother							
		Under 15	15-19	20-24	25-29	30-34	35-44	45 & Over	Unk.
Live births with birth weight specified	49,568	66	8,612	17,223	12,192	6,688	4,533	67	187
Total immature births	3,370	6	665	1,135	774	431	341	4	14
Per cent immature	6.8	9.1	7.7	6.6	6.3	6.4	7.5	6.0	7.5
4 lb 7 oz - 5 lb 8 oz	2,276	3	431	777	536	287	228	3	11
3 lb 5 oz - 4 lb 6 oz	594	2	138	183	130	67	71	1	2
2 lb 4 oz - 3 lb 4 oz	317	1	67	117	62	44	25	-	1
Less than 2 lb 4 oz	183	-	29	58	46	33	17	-	-

Since special facilities often needed for the care of immature infants are more likely to be found in hospitals than in the home, a comparison has been made between the proportions of hospital deliveries among immature and mature infants and is shown in Table 7. In the total group and white and Negro groups, the percentage of immature infants born in hospitals was greater than the percentage of mature infants born in hospitals, while the reverse was true for Indian births. The relatively low percentage of Indian immature infants born in hospitals may be accounted for by the distances between residence and Indian Hospital which are likely to be greater than distances between residence and general hospital facilities.

Table 7

Number and Per Cent of Immature and Mature Live Births
Occurring in Hospitals, by Race
Oklahoma, 1951

	Immature			Mature		
	Total	Hospital	Per Cent	Total	Hospital	Per Cent
Total	3,370	2,968	88.1	47,227	41,003	86.8
White	2,885	2,666	92.4	41,986	37,440	89.2
Negro	392	243	62.0	3,407	1,911	56.1
Indian	93	59	63.4	1,834	1,652	90.1

STILLBIRTHS

The smallest number of stillbirths ever counted, 764, occurred to residents of Oklahoma during 1951. The smallest number previously reported was for the year 1950 when 825 were counted. The ratio of stillbirths to live births was 15.1 per 1,000 in 1951 compared with 16.3 per 1,000 in 1950. The stillbirth ratio was lower for the white racial group than for the Negro and Indian groups, the ratios being 13.8, 28.2, and 20.8, respectively. Table 8 shows numbers and per cents of stillbirths by attendant and place of occurrence, by race.

Table 8

Stillbirth Attendance by Race, Number and Per Cent,
Oklahoma, 1951

Attendance at Birth	Total		White		Negro		Indian	
	Number	Per Cent						
Total	764	99.9	617	99.9	107	99.9	40	100.0
Physician in hospital	662	86.6	550	89.1	73	68.2	39	97.5
Physician in mat. home	-	-	-	-	-	-	-	-
Physician in home	82	10.7	60	9.7	21	19.6	1	2.5
Midwife	16	2.1	4	0.6	12	11.2	-	-
Other and unknown	4	0.5	3	0.5	1	0.9	-	-

A stillbirth, according to the State's legal definition, is a birth which is not a live birth at 20 weeks or more gestation. By law, a special stillbirth certificate must be filed for each such event.

The numbers of stillbirths attributed to various important causes, together with the percentages, are included in Table 9 for 1951 in Oklahoma. A more detailed tabulation of the data from the stillbirth certificates revealed certain interesting facts not included in the table. One of these was that only nine stillbirths during the year were attributed to maternal syphilis, five of which specified syphilitic infection in the fetus itself; another was that of the eight stillbirths assigned to acute disease in the mother, four were due to influenza. No fetal deaths were attributed to absorption of narcotic or other toxic substance from the mother. When more than one cause of stillbirth was mentioned on one certificate, and a logical sequence could not be established, then precedence was given to causes determined in the fetus, placenta, and cord, when these were included on the certificate with causes and conditions in the mother.

Table 9
Resident Stillbirths, by Cause of Stillbirth
Oklahoma, 1951

Cause of Stillbirth	Number	Per Cent
Total	764	100.0
Causes Determined in the Mother, or Related to Pregnancy:		
Diabetes mellitus (Y30.2)	4	0.5
Chronic disease of genito-urinary system (Y30.4)	-	-
Other chronic diseases (Y30.0, .1, .3, .5)	12	1.6
Acute disease in mother (Y31)	8	1.0
Toxemias of pregnancy (Y32.3, .4)	62	8.1
Infection (ante- and intra-partum) (Y32.5)	12	1.6
Difficulties in Labor (Y34)	52	6.8
Self-induced abortion (Y32.0)	-	-
Accident or violence (Y35.0, .1)	11	1.4
Other and ill-defined causes in mother (Y32.1, .2, Y33, Y35.2, .3)	5	0.7
Causes Determined in the Fetus, Placenta or Cord:		
Placenta and cord conditions (Y36)	285	37.3
Birth injury (Y37)	3	0.4
Congenital malformations of fetus (Y38)	62	8.1
Erythroblastosis (Y39.2)	29	3.8
Other causes determined in the fetus (Y39.0, .1, .3)	6	0.8
Ill-defined causes (Y39.4, .5)	58	7.6
Cause unspecified (Y39.6)	155	20.3

On the stillbirth certificate, a space is provided for information regarding any operative procedure involved. No operation (except perhaps episiotomy) was performed in 531 of the 764 stillbirths. In 130 other cases, no statement was made as to whether or not there was an operation for delivery.

Table 10
Resident Stillbirths, According to Whether Death Occurred Before or During Operation, By Race, Number and Per Cent, Oklahoma, 1951

Time of Death	Total		White		Negro		Indian	
	Number	Per Cent						
Total Operations	103	100.0	85	100.0	12	100.0	6	100.0
Before operation	64	62.1	54	63.5	6	50.0	4	66.6
During operation	17	16.5	14	16.5	2	16.7	1	16.7
Not stated	22	21.4	17	20.0	4	33.3	1	16.7

Operations were reported for 103 stillbirths, these operations including 55 Cesarean sections and 17 forceps deliveries, two of which were specified to be with version. Table 10, above, indicates that in three-fifths of the 103 cases where operative procedure was used, fetal death had occurred before operative intervention.

Besides the information regarding operations, the standard stillbirth certificate form requests the time of death with respect to the onset of labor. This information was omitted, however, from 111 of the certificates in 1951. Table 11 contains a tabulation of this item for each racial group.

Table 11
Resident Stillbirths, According to Whether Death Occurred Before or During Labor, by Race, Number and Per Cent, Oklahoma, 1951

Time of Death	Total		White		Negro		Indian	
	Number	Per Cent						
Total Stillbirths	764	100.0	617	100.0	107	100.0	40	100.0
Before labor	455	59.6	365	59.2	61	57.0	29	72.5
During labor	198	25.9	162	26.3	26	24.3	10	25.0
Not stated	111	14.5	90	14.6	20	18.7	1	2.5

TOTAL DEATHS

For 1951, Oklahoma's crude death rate was 9.0 per 100,000 estimated population, based on 20,082 resident deaths. The rates for the white, Negro, and Indian populations were 8.7, 12.4, and 11.2, respectively. These rates, and the figures on which they are based, may be found in Tables I and II in the Appendix, together with data for important causes of death.

The death certificates supplying the information from which these figures were compiled, varied widely in the completeness of the information included. In all but 38 cases, however, the age at death was obtained, and the average age was determined to be 60.38 years. Those surviving beyond the first year of life died at an average age of 65.46 years.

LEADING CAUSES OF DEATH

The eight leading causes of death in 1951 were the same as in 1950, and were in the same order except that tuberculosis dropped from seventh to eighth rank, exchanging places with nephritis and nephrosis. The three most important causes — heart disease, malignant neoplasms, and vascular lesions of the central nervous system — together accounted for more than one-half of the total deaths.

Not only were the eight leading causes of death in 1951 the same as in the previous year; except for order, they had not changed in 20 years. The proportion of the total number of deaths assigned to each cause, however, had undergone a great deal of variation. Table 12, below, shows the number of deaths assigned to each of the leading causes of death in 1951 compared to the numbers assigned in 1941 and 1931 (adjusted by means of the comparability ratio to eliminate, so far as possible, the effect of the change in coding procedures).

Table 12

Leading Causes of Death, Oklahoma, 1931, 1941, 1951

Cause of Death	1931*	1941*	1951
Total deaths	18,802	20,097	20,082
Diseases of the heart	2,572	4,596	6,279
Cancer	1,269	1,953	2,843
Vascular lesions of the central nervous system	1,495	1,897	2,536
Accidents	1,285	1,377	1,500
Congenital malformations	1,054	1,395	1,173
Pneumonia	1,433	984	518
Nephritis	507	609	445
Tuberculosis	1,265	1,023	422

* Comparability ratio applied to numbers of deaths from specific causes.

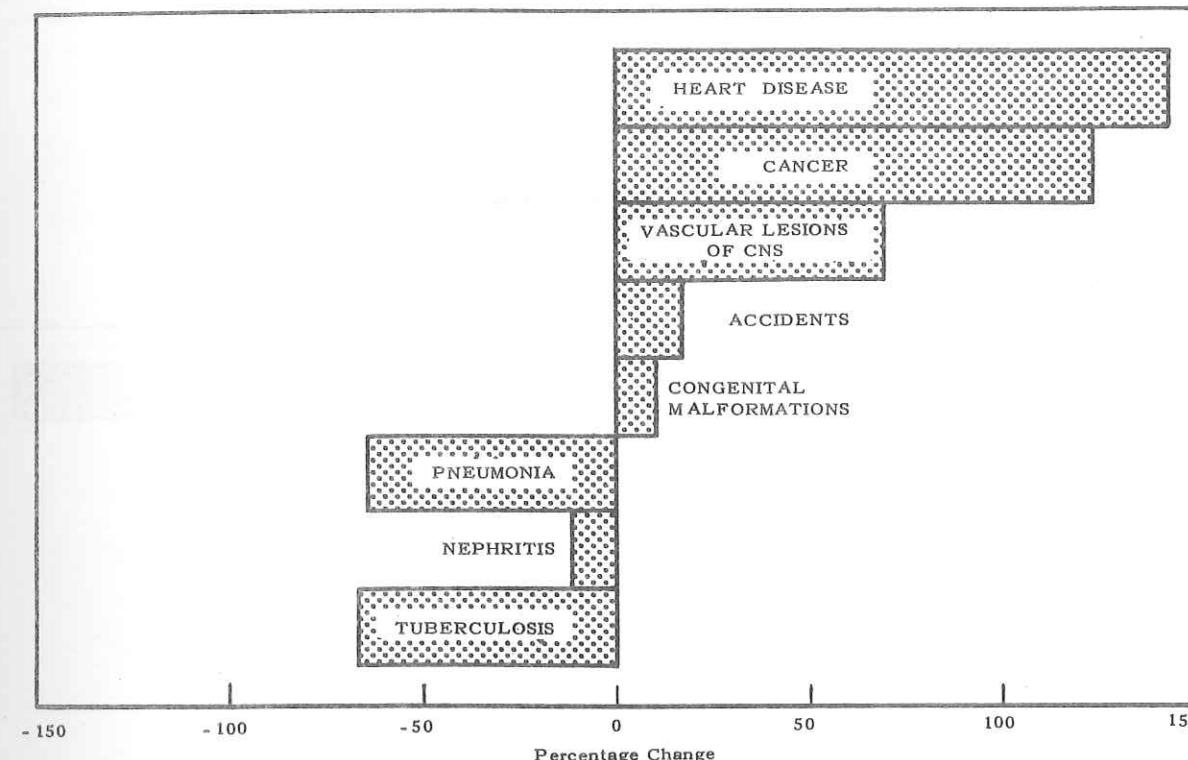

In 1931, the eight leading causes together were responsible for 57.9 per cent of the total deaths; in 1941, for 68.8 per cent; and in 1951, for 78.3 per cent. The net change in 20 years is more clearly seen in Chart 3, showing the percentage change of 1951 figures from those for 1931. The number of deaths assigned to heart disease and to cancer more than doubled during the period, with a somewhat smaller proportionate increase in vascular lesions of the central nervous system. Pneumonia and tuberculosis showed large decreases in mortality.

Deaths from the three leading causes, which were also the three showing the greatest percentage increase in Chart 3, usually occur at the higher ages. About 70 per cent of the deaths at 65 and over were assigned to causes in this group. At ages 45 to 64, about 67 per cent were so assigned. "Congenital malformations and certain diseases of early infancy" was the most important cause of death in the age group 0-4 years, resulting in about 60 per cent of the deaths. Accidents, the second most important cause in this group, accounted for 8 per cent. The latter cause was the most important in each of the age groups from 5 through 34 years, as may be seen in Table IV, in the Appendix.

Both suicide and homicide were among the leading causes of death for the age groups from 15 through 44 years. Maternal causes appeared in the list for groups 15-24 and 25-34. The total number of deaths occurring in these young adult ages was, of course, quite small. Further data on cause of death by age, race, and sex may be found in Table III.

Chart 3

Percentage Change in Deaths Assigned to the Leading Causes 1951 over 1931, Oklahoma

Heart Disease

Heart disease was responsible for 6,279 deaths of Oklahomans in 1951. The death rate, higher than for any year in the past, was 281.0 per 100,000 estimated population.

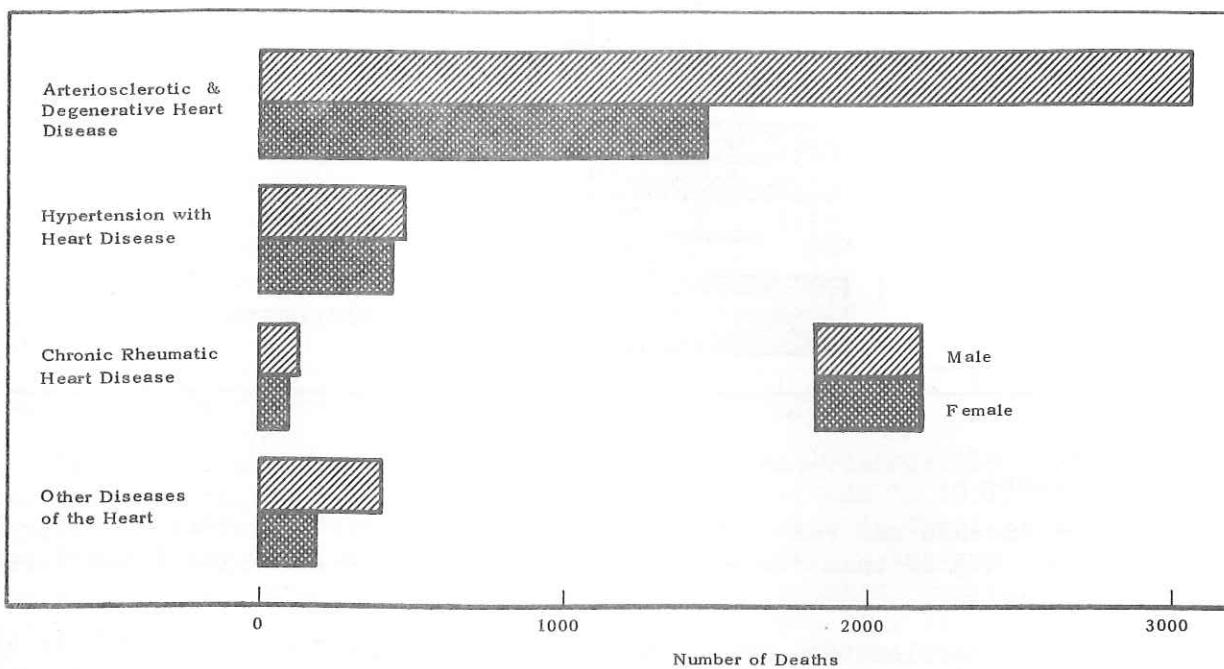

The arteriosclerotic and degenerative heart diseases led the list with 4,541 deaths, 72.3 per cent of the total for all heart conditions, while 14.7 per cent were assigned to hypertensive heart diseases, 3.6 to chronic rheumatic heart disease, and 9.4 per cent to other diseases of the heart. Statistics for these four major groups are included in the tables in the Appendix. Chart 4 shows the way in which the deaths were distributed by sex.

In addition to sex, race and age were significant factors in death from heart disease. The rates for the white and Negro populations were about the same -- 282.8 and 280.4, respectively -- while the Indian rate was much lower -- 213.9 per cent. Of the total number of deaths of males, 34.2 per cent were attributed to diseases of the heart, while only 27 per cent of the deaths of females were so assigned. The age distribution of these deaths varied a great deal between the race-sex groups. While 69.9 per cent of the total number of heart disease deaths were at ages 65 and over, for white females the figure was 81.6 per cent, and for Negro females, 49.1 per cent, other groups showing intermediate percentages. Approximately 38 per cent of all deaths at 65 and over were due to heart disease.

Two conditions not included in this category are closely related to these diseases, and may be mentioned here -- congenital heart disease and rheumatic fever. Congenital heart disease is discussed later in this publication, with other congenital malformations. There were 18 deaths due to rheumatic fever in 1951, 12 of which were specified as having heart involvement, 4 without mention of such involvement, and 2 specified as chorea. These deaths were, of course, in addition to 225 from chronic rheumatic heart disease.

Chart 4

Deaths from Major Types of Heart Disease, by Sex,
Oklahoma, 1951

Malignant Neoplasms

Malignant neoplasms, including leukemia and other neoplasms of lymphatic and hematopoietic tissues, were second in importance as a cause of death in 1951, accounting for 14.2 per cent of the total deaths.

Age, sex, and race all appeared to be important factors in cancer mortality, for certain sites at least. In the total for all sites, though, the difference in rates was not very great between the races. For the total population, the death rate was 127.2 per 100,000 estimated population. Both the white and Negro populations had rates of 127.1, while the Indian rate was 132.0.

Sex differences in mortality from cancer of various sites are indicated in Table 13. The categories used in this table differ somewhat from those included

in the Appendix, but are the same as in the cancer tabulations in Part I of Public Health Statistics, Reportable Diseases. Chart 5 shows the way in which cancer mortality in each sex varied with age.

Table 13

Resident Deaths from Malignant Neoplasms, by Primary Site,
by Sex, Oklahoma, 1951

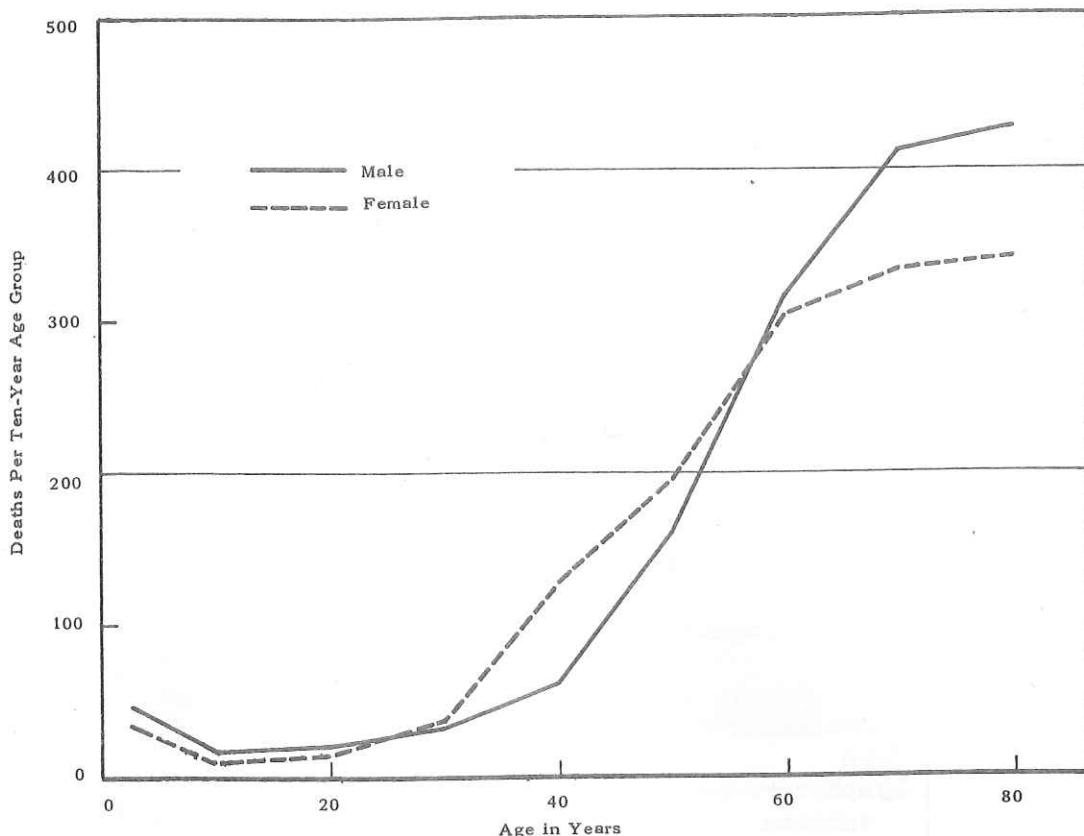

Site	Male	Female
Total	1,467	1,376
Buccal cavity and pharynx	49	12
Digestive organs and peri-toneum	619	438
Nose, nasal cavities, middle ear, and accessory sinuses	8	1
Other respiratory organs	188	42
Breast	3	214
Uterus	-	266
Other female genital organs	-	63
Male genital organs	178	-
Urinary organs	78	49
Skin	44	24
Brain and other parts of the central nervous system	40	29
Bone	16	18
Lymphosarcoma and reticulosarcoma	23	17
Hodgkin's disease	21	8
Leukemia and aleukemia	83	57
Other neoplasms of lymphatic and hematopoietic tissues	14	17
Other and unspecified organs	103	121

As has been the case each year since 1948, more deaths of males than of females were assigned to cancer. In 1951 the figures were 1,467 and 1,376, respectively. Also, more deaths of males than of females were attributed to most of the sites common to both sexes.

The cancer in more than one-third of the decedents was primary in the digestive organs or peritoneum, and these sites were most important in both sexes. The next most important site for men was the respiratory system, with 188 deaths; for women, the uterus, with 266 deaths. Of the uterine cancers, 124, or 26.6 per cent, appeared from information on the death certificate to have originated in the cervix. Only 9 had their primary site in other parts of the uterus, while for 133 deaths the exact location was unspecified. The third most frequently reported site for males was the genital organs. Of the 178 cancers in this group, the primary site of 160 was in the prostate.

Chart 5

Resident Deaths from Malignant Neoplasms, by Age Group,
Each Sex, Oklahoma, 1951

Vascular Lesions of the
Central Nervous System

The generally upward trend in the number of deaths from cerebral hemorrhage and related conditions continued in 1951 with 2,536 such deaths having been recorded, compared to the 1950 figure of 2,246, the largest number previously reported. The death rates showed considerable difference between the racial groups, being 162.9 for the Negro group, 111.2 for the white, and 67.0 for the Indian. These rates were all somewhat higher than in 1950, when they were 136.1 for the Negro group, 99.2 for the white, and 55.8 for the Indian. As in other years, the sex difference was small; 52.4 per cent of the deaths were of males. Age, however, was an important factor; only 3 per cent of the deaths were at less than 45 years of age, while 80 per cent were at 65 years and over.

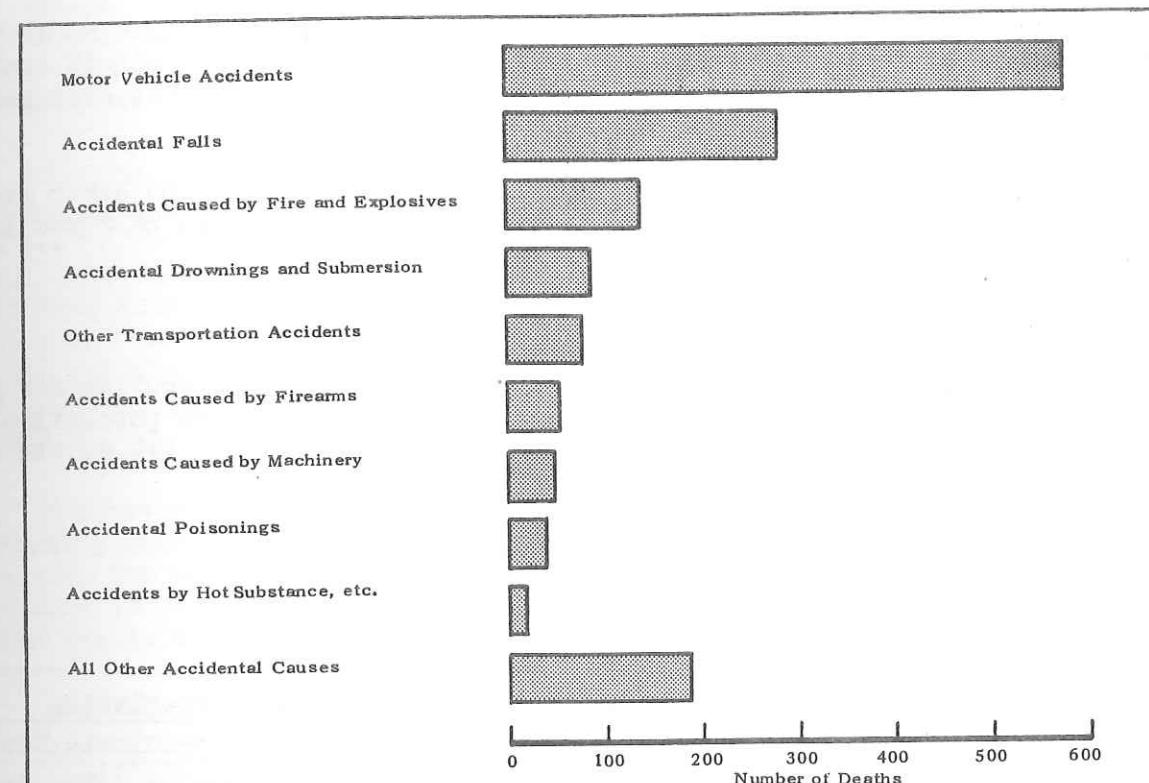

Accidents

Accidents continued to be the fourth leading cause of death in the entire population, and the leading cause in the 5-34 years age groups. (See Table IV in the Appendix.) The 1,500 deaths recorded from this cause in 1951 represented a considerable increase over the 1,350 in 1950. Deaths from motor-vehicle accidents increased from 522 to 577, and all other accidents from 828 to 923.

The number of deaths assigned to various types of accidents is indicated in Chart 6. These categories are the same as those included in Table I in the Appendix, which also shows numbers and rates by race. Further information about accidental deaths in 1951 will be available in Part III of Public Health Statistics, Accidental Deaths.

Chart 6

Accidental Deaths by Cause of Injury
Oklahoma, 1951

Congenital Malformations and
Certain Diseases of Early Infancy

The large proportion of deaths of infants assigned to "congenital malformations and certain diseases of early infancy" has made that the fifth leading cause of death in Oklahoma. Since all but 5 per cent of the deaths assigned to these conditions were at less than one year of age (this 5 per cent comprising 57 deaths due to congenital malformations, and one each in the categories "post-natal asphyxia and atelectasis" and "ill-defined diseases of early infancy, and immaturity unqualified") discussion of this cause is included in the section on Infant and Neonatal Deaths.

Pneumonia

The 518 deaths assigned to pneumonia made this disease the sixth leading cause of death. Not included in this group were deaths due to pneumonia with influenza, 47; deaths due to hypostatic pneumonia, 34; and deaths due to pneumonia of the newborn, 16. These were included elsewhere.

While this condition is no longer so important a cause of death as in the past, in 1951 it was still the third leading cause of death in the ages 0-4 years, and the fifth leading cause at ages 65 and over.

Nephritis and Nephrosis

The number of deaths due to nephritis and nephrosis was the same as that reported in 1950 -- 445. In 1950 these diseases comprised the eighth leading cause of death, but on account of the drop in the number of deaths assigned to tuberculosis, in 1951 this cause attained the seventh rank.

The rate for the Negro population was much higher than for the other racial groups. This rate was 59.8, while the Indian and white rates were 24.2 and 16.9, respectively.

Tuberculosis

In 1951, tuberculosis continued its downward trend, accounting for only 2.1 per cent of the total deaths. The death rate for the entire population was 18.9, compared to 22.4 in 1950. As usual, the Indian rate, 119.0, was much higher than the white rate, 14.8, and the Negro rate, 38.5.

Table 14
Tuberculosis Deaths in State Mental Institutions and in the General Population Number and Per Cent, Oklahoma, 1951

Age in Years	State Mental Institutions			General Population		
	Total Deaths	Tuberculosis Deaths		Total Deaths	Tuberculosis Deaths	
		Number	Per Cent		Number	Per Cent
All ages	595	40	6.7	20,082	422	2.1
Under 15	9	-	-	2,174	24	1.1
15-24	14	3	21.4	438	23	5.3
25-34	21	9	42.9	560	54	9.6
35-44	32	11	34.4	931	63	6.8
45-54	53	7	13.2	1,657	67	4.0
55-64	94	6	6.4	2,859	77	2.7
65-74	159	2	1.3	4,546	74	1.6
75 and over	211	2	0.9	6,879	39	0.6
Unknown	2	-	-	38	1	-

The number of deaths from tuberculosis decreased in the state-operated mental institutions, as well as in the general population. While in 1950 7.7 per cent of the deaths in mental institutions were due to tuberculosis, in 1951 only 6.7 per cent were due to this disease. The table above compares the proportionate mortality from tuberculosis in state mental institutions and in the general population.

COMMUNICABLE DISEASES

Deaths from acute communicable diseases have followed a downward trend for the past several years. Although the number of deaths from these diseases is relatively small, they present a constant threat which merits the attention of those concerned with preventive as well as curative medicine.

In 1951, typhoid and paratyphoid fevers caused 4 deaths (2 deaths assigned to each disease), all of which occurred in the white population, compared to one death from typhoid and none from paratyphoid in 1950. Only 6 deaths from diphtheria were reported, 3 less than the number of deaths in 1950. The death rate from this cause was 0.3 per 100,000 estimated population. All deaths were in the 1-9 years age group. Whooping cough accounted for 18 deaths. Eleven of the decedents were under one year of age; one was in the 10-14 years group; and the rest were aged from one to four years. Eight were white, 7 Negro, and 3 Indian.

Measles accounted for 25 deaths in 1951, compared to only one death in the preceding year. The rate of 11.2 for the Indian population was high in comparison with the white rate, 0.8, and the Negro rate, 1.4. All the deaths except two were in the 0-14 years age group; one was in the 20-24 years group; the other was in the group 75 years and over.

Five of the 16 deaths due to dysentery were attributed to the bacillary form of the disease, 3 to amebic dysentery, while 8 were unspecified as to type. The rate was highest in the Negro population, 4.1, with the Indian rate only slightly lower, 3.7. The white rate was very small, 0.4. Deaths from diarrhea and enteritis (not separately available from the categories included in the tables) comprised 3 from diarrhea of the newborn (International List Number 764) and 56 from other gastro-enteritis and colitis (International List Number 571).

The number of deaths due to acute poliomyelitis, 38, was the same as that reported in 1950. In addition to these 38 deaths, 2 were reported as due to late effects of poliomyelitis. Thirty-eight of the deaths were in the white population; one was Indian and one Negro.

Scarlet fever accounted for one death in 1951, and streptococcal sore throat, for 9. In 1950, no deaths were assigned to scarlet fever and 6 to streptococcal sore throat.

MATERNAL DEATHS

The death rate for maternal causes was 1.1 per 1,000 live births in 1951, the lowest recorded, except for the 1949 rate of 0.9. The total number of deaths attributed to these causes was 55.

Childbearing was most hazardous in the Negro racial group, where the rate was 4.7 deaths per 1,000 live births, compared to 3.6 for the Indian group, and 0.7 for the white. Table 15 shows the number of deaths in each racial group from important maternal causes.

Table 15

Maternal Deaths by Cause, by Race, Number and Rate*,
Oklahoma, 1951

* Number per 1,000 live births.

The age at death of these women is indicated in Table 16. When these figures are compared with the data for mother's age in the birth tables, it is found that the death rate was highest in the age group 35-44 years, where 4,654 live births were recorded and 17 maternal deaths occurred, for a rate of 3.7 maternal deaths per 1,000 live births.

Table 16

Maternal Deaths, by Cause, by Age
Oklahoma, 1951

Cause of Death	Total	Age					
		-15	15-19	20-24	25-29	30-34	35-44
All maternal causes	55	-	5	9	12	12	17

Abortion with sepsis	-	-	-	-	-	-	-
Other complications of pregnancy, childbirth, and the puerperium	17	-	1	2	3	3	8

Maternal deaths were the seventh leading cause of death in the 15-24 years and the 25-34 years age groups.

INFANT DEATHS

Although the number of live births was less than one per cent greater in 1951 than in 1950, the number of infant deaths showed an increase of 3.4 per cent. The 1951 death rate was 30.8 per 1,000 live births. Table 17 shows the number of deaths and rate for each cause. More detailed data concerning infant deaths will be available in a special study now in preparation involving the matching of birth and death certificates. This study will include information dealing with cause of death in connection with such factors as birth weight, period of gestation, and age of mother.

The number of infant deaths assigned to each cause showed very little change from 1950 and 1949. The assigned cause resulting in the greatest number of deaths was immaturity, with 367, followed by congenital malformations, with 217, and postnatal asphyxia and atelectasis, with 209. Prior to 1950, the last cause was included with "other certain diseases of early infancy," as was hemolytic disease of the newborn (erythroblastosis). While the number of deaths assigned to erythroblastosis was comparatively small (34), it was included in Table 17 as a separate category because of the interest in recent years in prevention of deaths from this cause. Pneumonia (including pneumonia of the newborn) accounted for 126 infant deaths in 1951, compared to 149 in 1950, and 151 in 1949. Accidents showed a slight increase, from 53 deaths in 1949 and 49 in 1950 to 59 in 1951.

Deaths of Infants Under One Month of Age

Of the 1,560 infants dying in 1951 at an age of less than one year, 1,120, or 71.8 per cent, failed to survive the first month. Data for these deaths by cause and race are included in Table 18.

More deaths in this age group were assigned to immaturity than to any other category, 356 such deaths having been reported. Next most important was atelectasis with 204, followed by injury at birth with 158, and congenital malformations with 144.

In the white race the leading causes of neonatal death were the same as for all the races together. In the Negro racial group, though, pneumonia caused 12 deaths, compared to 10 for congenital malformations. In the Indian group, the leading causes were the same as for the white race, although in a somewhat different order. The numbers in this group assigned to each cause were quite small. The total number of Indian neonatal deaths was 46. For the white racial group, the number was 931, and for the Negro group, 143.

* Number per 1,000 live births.

All of the infant deaths attributed to syphilis occurred at less than one month of age. Other causes of infant death confined almost entirely to these younger ages were injury at birth, postnatal asphyxia and atelectasis, hemolytic disease of the newborn, and immaturity, as is apparent from a comparison of Tables 17 and 18.

About one-half of the neonatal deaths were in infants not yet one day old. The decline in the number of deaths per day was very sharp, and after the first week, only 13 per cent of the neonatal deaths occurred, as is apparent from the figures in Table 19.

Deaths of Infants One to Eleven Months of Age

Only 440 of the 1,560 infants dying in 1951 were from one to eleven months old (Table 20). The number of deaths per month showed a general decrease with increasing age.

The four leading causes of death were pneumonia, congenital malformations, accidents, and gastro-enteritis, in the order named. About 86 per cent of the deaths of infants from congenital malformations occurred in the first four months of life. All but one of the infant deaths due to whooping cough were in the 1-11 months age group. There were no deaths in this group due to syphilis.
