Forward

The information contained in this publication has been prepared as reference data, which may be used in planning of health programs. The information presented here is taken from birth, death, and fetal death certificates. Population estimates were obtained from the U.S. Bureau of Census and the Oklahoma Department of Commerce.

Philosophical considerations are made to the concept of providing commonly used data and giving a survey of the types of data available. Should more detailed information be required in some area, this office may be able to supply that on request. In regard to a break in the annual consistency of some tables, this office has consistent trend data on many factors related to births from 1975 through 2002 and deaths from 1980 through 2002.

Previous reports in this series have focused on maternal and child health issues. Beginning in 2002, this report has been expanded to include a more comprehensive review of deaths in Oklahoma. In addition to providing information related to deaths by county, many tables focus on leading causes of death by age, race and gender as well as providing related years of potential life lost.

In Vital records, we recognize the need to provide researchers, as well as the general public, rapid access to the information contained in these databases for the purpose of community planning. Communities have an increased desire to identify disparate subgroups of individuals at increased risk for poor outcomes because of age, race, ethnicity, region or other demographic characteristic. To accomodate this, a new web site was launched in 2002. The Oklahoma Vital Records Data Query system was developed to promote instantaneous access to aggregated birth and death data for the purpose of promoting information-driven decision making. In that vein, the web-site has been named OK 2 SHARE (OKlahoma Statistics on Health Available foR Everyone. www.health.state.ok.us/stats/vs

To accomplish this, the Health Care Information Division of the Oklahoma State Department of Health has developed a user-friendly data query system that will allow public health practitioners and researchers, as well as the general public, access to create customized tables without delay. Access is provided to data which can be broken down by various demographic, including age, gender, county, etc. Birth data from 1975 and death data from 1980 is now available for analysis. Data elements include:

Births : mother's age, mother's race and Hispanic origin, mother's education level, trimester prenatal care began, number of previous live births, plurality, and birth weight. Crude birth rates and fertility rates are available.

Deaths : age, race, Hispanic origin, gender, cause of death (std and rankable), ICD9 (1991-1998; ICD10 (1999+). Crude rates, age-adjusted to either state or national standards and years of potential life lost (YPLL) are also available.

In 2001, an intensive campaign was done to educate medical staff on the filing process and to raise awareness related to item non-response. New editing protocols were also put in place to monitor reporting. Additionally, Oklahoma became the 47th state to implement the new Electronic Birth Certificate (EBC) system. Those facilities that are not yet using the new system have continued to submit the information using the traditional paper format and they are entered into the system once they arrive at the state health department.

The birth certificate lists only the reported race of each parent. Until 1989, the National Center for Health Statistics (NCHS), the federal agency in charge of all Vital Records, used a complex algorithm to determine the race of the infant. Generally speaking, this formula identified the race of the infant as the race of the darker parent. In 1989, both classifications were reported. Since then, national comparisons with race can be made only using that of the mother. In this office, we have data using both classifications back to 1975.

The American Indian population does not reside within reservation boundaries in Oklahoma, and is, therefore, more heterogeneously distributed throughout the population of the state. As a result the standard way of classifying race does not reliably document the American Indian births and infant deaths. Special attention should be given to the data when studying information related to race.

When calculating percentages, unknown values are subtracted from the total number of births. Therefore, the percentages are based solely on reported values.

Other types of data and more detailed information from Vital Statistics may be requested by contacting Health Care Information, (405) 271-6225 of the Oklahoma State Department of Health.

Definitions

Live birth: An infant with signs of life at birth.

Low birthweight: A live birth weighing 5 lb. 8 oz. or less (under 2,500 grams).

Very low birthweight: A live birth weighing 3 lb. 5 oz. Or less (under 1,500 grams).

Prenatal Care:

First trimester - care beginning during the first 3 months of pregnancy

Adequate care - entry in first trimester and 10 or more visits

Little care - entry in first or second trimester and 1 to 3 visits

Late care - entry in third trimester with 1 or more visits

No care - never entered care (coding - zero trimester with zero or unknown visits, or unknown trimester with zero visits)

Low education: less than 12 grades of school completed

Unmarried: never married, divorced, or widowed at the time of the infant's birth

Fertility: births to a particular population of women (i.e. age group and/or race)

Birth interval: measured among mothers with a previous delivery.

Calculated as the number of months between most recent delivery and the previous delivery.

Short birth interval : < 18 months or < 24 months

High parity:

Teens - under 20 years of age with 2 or more previous births

Adults - ages 20 and over with 4 or more previous births

Gestational age: the time in weeks from last reported menses to birth

Race: the race of mother unless otherwise specified

County: the county of residence unless otherwise specified

Infant Death: a live birth dying before completing one year of life

Neonatal death: a live birth dying before 28 days of life

Post-neonatal death: a live birth dying between 29 days and one year of life

Fetal death (still birth): fetus 20 weeks or more gestation, born dead

Perinatal death: combined fetal and neonatal deaths

Years of Potential Life Lost (YPLL): Measure the impact of certain conditions which cause increased death among younger persons. Based on the number of years of life lost for each death that occurs before a selected endpoint.

Age 65 - productive life lost

Life expectancy - total life lost

Cause of Death:

Deaths which occurred from 1999-2001 on were classified using ICD-10. The lists of 113 selected causes, 50 rankable causes and 39 selected causes are the lists that are used for general analysis. The Rankable Causes were selected from these lists by excluding those causes which were vaguely categorized (i.e. symptoms, signs, and abnormal clinical findings, those not elsewhere classified and all "other" categories) (2). Specific ICD-10 codes for the 113 Selected Causes, 50 Rankable Causes and 39 Selected Causes can be found in the appendices of this document.

Formulas

Note: When calculating percentages for various maternal characteristics, the unknown values are always subtracted from the total values before the calculation is undertaken. Some of the tables in this document do not show the unknown values; however, they are used in the computations.

Birth rate (crude):
$$\frac{\text{All live births}}{\text{Total population}} \times 1,000$$

Fertility rate (age-specific birth rate):
$$\frac{\text{Births to women in specified age group}}{\text{Population of women in specified age group}} \times 1,000$$

Percent low birthweight:
$$\frac{\text{All births less than 2,500 grams}}{\text{All births minus births of unknown birthweight}} \times 1,000$$

Percent short birth interval:
$$\frac{\text{All births less than 24 months}}{\text{All births minus no previous births and unknown}} \times 1,000$$

Note: A similar calculation is made for short birth interval of less than 18 months. Only the primary birth is included in the case of multiple births.

Percent high parity:

Teens:
$$\frac{\text{Births to women less than 20 years with 2 or more previous births}}{\text{All births to women under 20 years with a previous birth}} \times 1,000$$

Adults:
$$\frac{\text{Births to women 20 years or older with 4 or more previous births}}{\text{All births to women 20 years or older with a previous birth}} \times 1,000$$

Mortality Rate (Death Rate):
$$\frac{\text{All resident deaths}}{\text{Resident population}} \times 100,000$$

Age Specific Mortality Rate (Death Rate):
$$\frac{\text{Number of resident deaths in that age group}}{\text{Population within that age group}} \times 100,000$$

Infant mortality rate:
$$\frac{\text{All infant deaths}}{\text{All live births}} \times 1,000$$

Neonatal mortality rate:
$$\frac{\text{All neonatal deaths}}{\text{All live births}} \times 1,000$$

Post-neonatal mortality rate:
$$\frac{\text{All post-neonatal deaths}}{\text{All live births}} \times 1,000$$

Fetal mortality rate:
$$\frac{\text{All fetal deaths}}{\text{All live births}} \times 1,000$$

Perinatal mortality rate:
$$\frac{\text{All fetal deaths + all neonatal deaths}}{\text{All live births + all fetal deaths}} \times 1,000$$

Age Adjusted Mortality Rate (Death Rate):

Oklahoma 2000 Standard Population =
$$\frac{\text{Age Specific Mortality Rate} \times \text{Population within that age group}}{\text{Oklahoma 2000 population}}$$

United States 2000 Standard Population =
$$\frac{\text{Age Specific Mortality Rate} \times \text{Population within that age group}}{\text{US 2000 population}}$$

when calculating the rate for combined years the population is the sum of the populations for the specified time span
